

RIVM2016.csv Data format

Rivm2016.csv contains a subset of the 2016 impact data for the Netherlands as compiled by the RIVM.

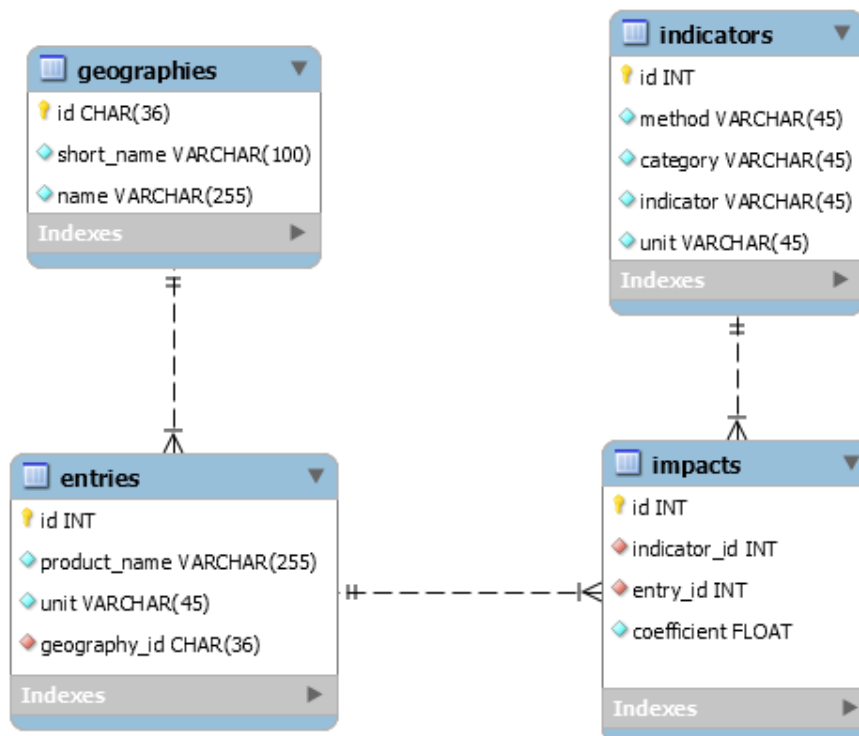

The first row describes the headers, most of which are `indicator` names. The second row contains the units for each of the `indicators`.

All `indicators` are split by colons (:) into 3 parts; `method`, `category` and `indicator`. The ecoinvent process column is split by commas (,) into 4 parts; product name, geography (in square brackets), method and data source. Any `indicators` or entries that do not follow this format, can be ignored.

The `geography` data required for this set is not included as a csv file, as it concerns only a single entry: (NL,NLD,The Netherlands)

Import this entry as you see fit.

The suggested model for this data looks as follows:

Note: The actual data model you'll implement, does not have to be exactly like this.
